Overview

The aim of this lab is to get you familiar with developing Hyperledger Composer business networks. We will do this by exploring the Composer modelling language, how to write transaction processor functions in JavaScript and lastly examine how Access Control is managed in Composer.

The lab will also familiarise you with the Composer Playground, a web-based tool that allows for rapid development and testing of Composer business networks.

It should be noted that while the contents of this lab will predominantly occur within Composer Playground (for the sake of accelerating the learning and development process), the Lab can easily be completed offline and using a text editor such as Visual Studio Code or Atom. In this case please refer to the next Lab for instructions on how to use the command line tools available in Composer.

Section 1.Starting the Hyperledger Composer Playground

1.1. Accessing the environment

After Lab 1 you should have all the environment – Hyperledger Fabric infrastructure and Hyperledger Composer up and running.

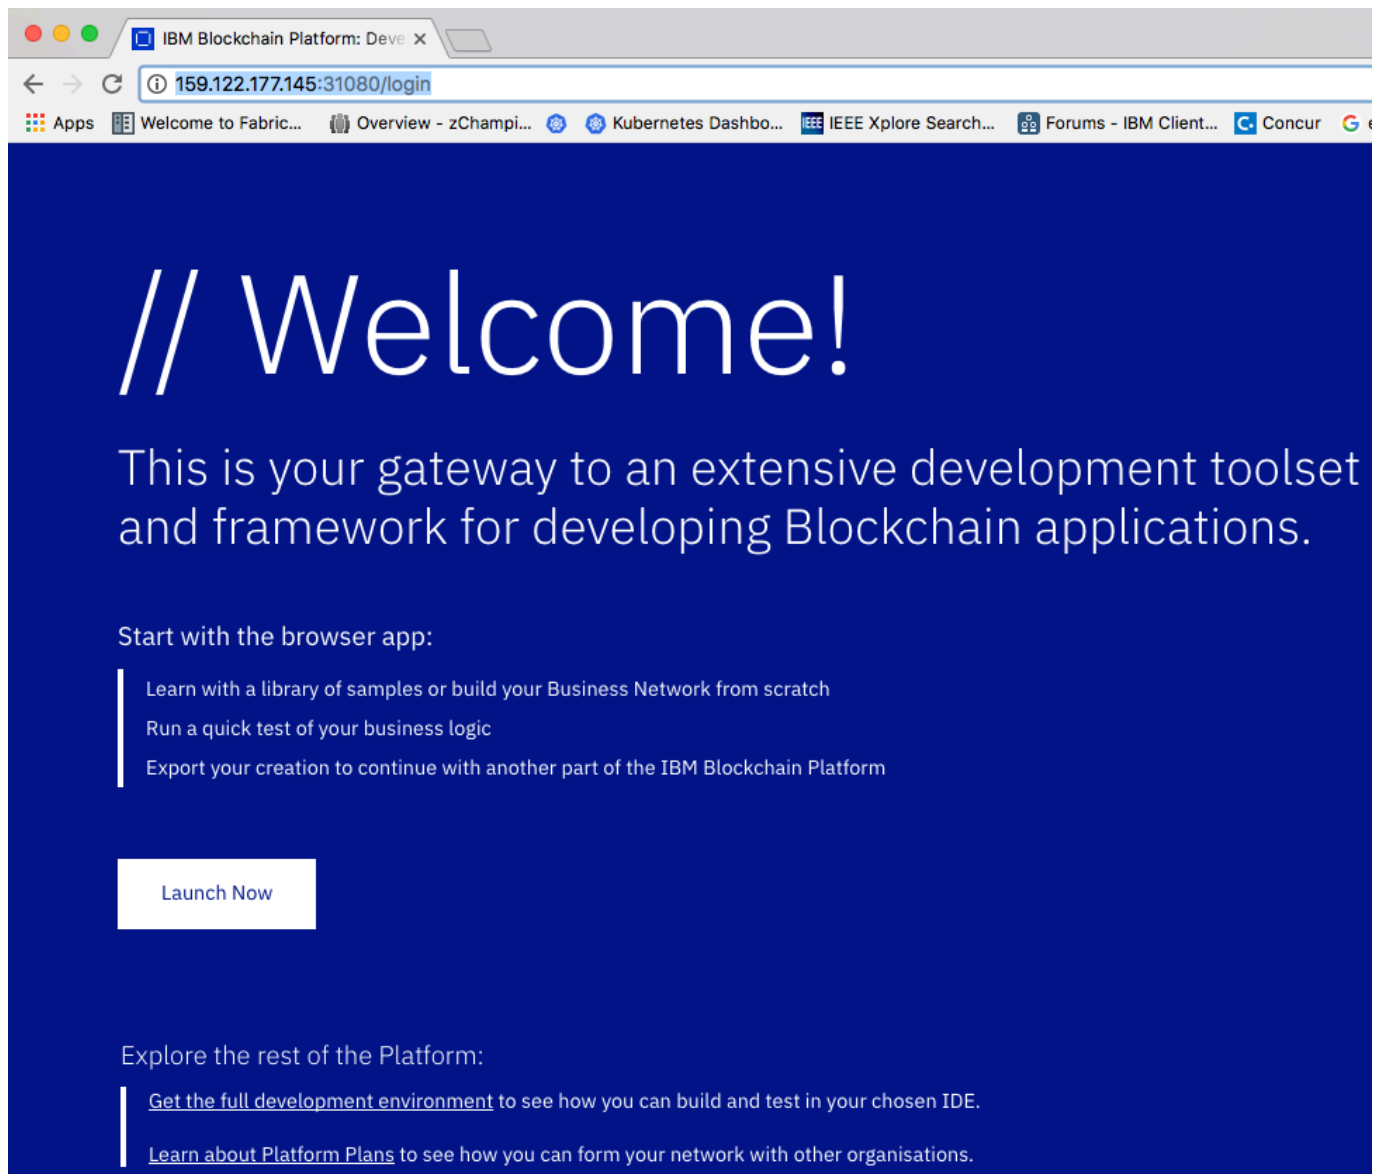

Let’s open the Composer Playground (using Firefox browser):

<YOUR PUBLIC IP ADDRESS>:31080

You can retrieve your Public IP address from your terminal using the command:
\$ bx cs workers <name of the cluster>

ID	Public IP	Private IP
kube-mil01-pa5da85267bee540d0b0954ed59495f0e7-w1	xxx.xxx.xxx.xxx	yy.yyy.yyy.y

You should launch Firefox and open the playground web UI, and then press Launch Now:

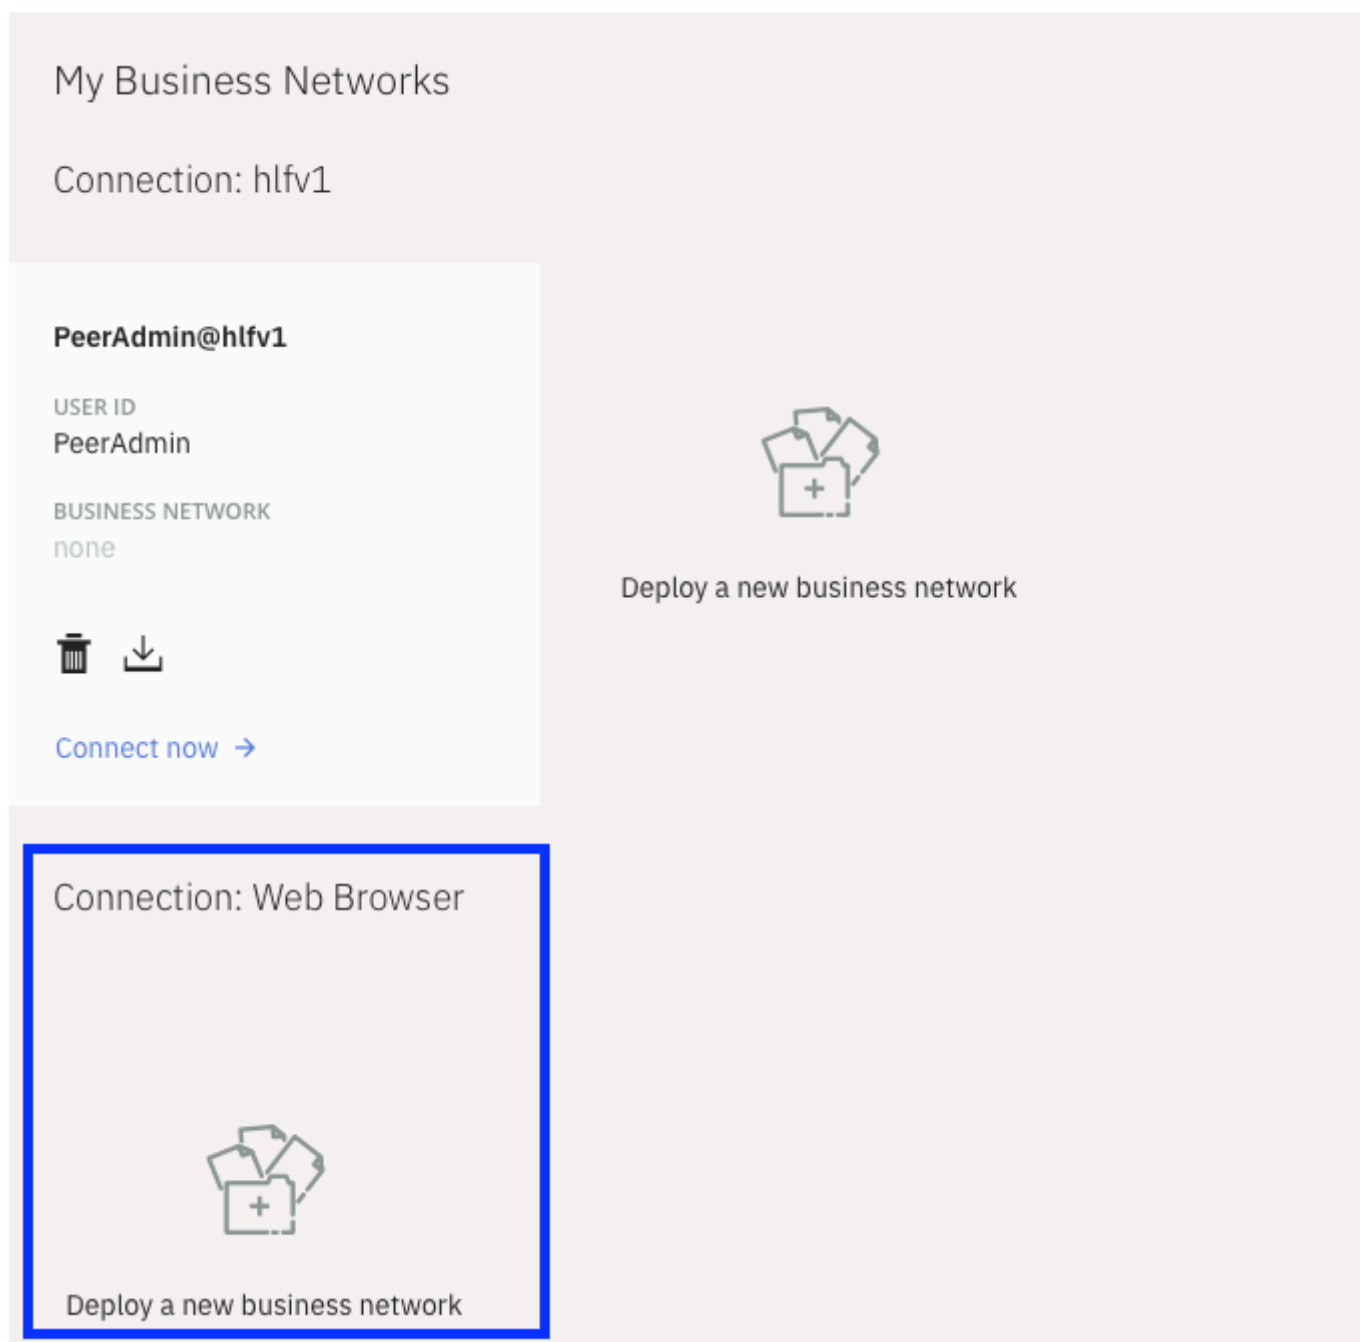

Section 2. Composer's Modelling Language

In this section you will learn about the modelling language Hyperledger Composer uses to define resources in its business networks. You will define a basic business network that allows participants to exchange marbles with each other, using this as a base from which to explore the language's features.

2.1. Creating new business network

- a. **Select Connection: Web Browser and then click Deploy a new business network:**

Enter the details – name of your new network, description and then the network admin card. Select **'Empty Business Network'** from the list and then click **Deploy**

My Wallet Not sure where to start? View our Playground

Deploy New Business Network

1. BASIC INFORMATION

Give your new Business Network a name:

Describe what your Business Network will be used for:

Give the network admin card that will be created a name:

2. MODEL NETWORK STARTER TEMPLATE

Choose a Business Network Definition to start with:

Choose a sample to play with, start a new project, or import your previous work

basic-sample-network

Press Connect now

c. Adding files

We will be adding the following files that define the business network, transactions and access control.

Add a file

Upload a file from your computer...

Drop here to upload or [browse](#)

☐

Model File (.cto)
Define Assets, Participants and Transactions using Hyperledger Composer modelling language.

☐

Script File (.js)
Define the logic of transaction executions using JavaScript.

☐

Query File (.qry)
Define the queries in here (Note: you can only have 1 of these per .bna).

☐

Access Control File (permissions.acl)
Define your access controls here (Note: you can only have 1 of these per .bna).

Cancel

Add

d. Add a model file

Let's start with a Model file (.cto)

Web tutorial-network
Define
Test

FILES

About
README.md

Model File
models/org.acme.model.cto

Access Control
permissions.acl

Model File models/org.acme.model.cto

```

1  /**
2  * New model file
3  */
4
5  namespace org.acme.model

```

e. Resources

Composer's modelling language is first and foremost oriented around high level business concepts. As such, the **three top-level resources** that can be defined are as follows:

Assets	Participants	Transactions
<i>Digital representations of assets that are recorded on the ledger.</i>	<i>Individuals and Organisations that will contribute to and make use of the ledger.</i>	<i>Business logic governing the manipulation of assets.</i>

Additionally, each resource belongs to a namespace (a default namespace is at the top of the newly created file) which acts in a similar manner to how namespaces and packages work in other languages. In much the same way, resources can be imported from other namespaces. Namespace names can be any combination of letters and periods.

The modelling language describes these resources in a similar manner that you would describe a class in another language, this being an entity with attributes.

f. Writing an asset

Below is the **example** on how one can define an asset, participant and transaction. Please follow the lab's scenario to create your own.

Creating the asset Marble:

```
asset Marble identified by Id {  
    o String Id  
}
```

This defines a Marble asset and gives it an identifier to be referred to by (similar to the keys used in Fabric). Let's add the attributes:

```
asset Marble identified by Id {  
    o String Id  
    --> Collector owner  
    o Integer diameter  
    o String colour  
}
```

You'll have noticed that the attributes in this do not all have the same prefix. The owner attribute is preceded by a --> instead of a o.

The o attributes are 'named fields' – they belong to the resource, for example the Marble will have a size and colour property.

The --> attributes are 'relationships' – while they make up the information that describes the resource they are not part of it, for example a Marble will have an owner but the owner is not part of the Marble.

The currently supported attribute types are as follows:

String, Boolean, DateTime, Integer, Double, Long

g. Writing a participant

Let's see how participants are defined:

```
participant Collector identified by email {  
    o String email  
}
```

Attributes for participants work in an identical manner to those of Marbles. As such, expand the Collector class:

```
participant Collector identified by email {  
    o String email  
    o String firstname  
    o String surname  
}
```

2.2. Writing a transaction

Transactions are also declared in the modelling file using the same syntax as with Assets and Participants, add the following to your modelling file:

```
transaction ChangeOwner {  
    --> Marble marble  
    --> Collector newOwner  
}
```

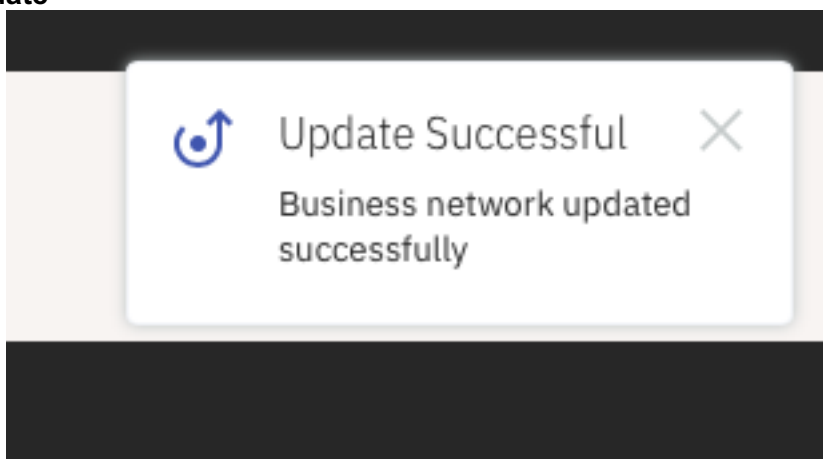

Instead of denoting attributes, the variables within the body of a transaction denote the arguments that the transaction logic function will take (this will be covered in more detail in the next section).

2.3. Deploy and create some test assets

Now let's make sure that there were no syntax errors and let's update the business network with new definitions:

a. Update the business network

Click on the button **Update**

Now we have some asset definitions, hit the Update button on the left side of the screen. On success a small pop-up should appear. Go to the **Test** tab at the top:

Participant registry for org.acme.model.Collector

+ Create New Participant

ID	Data
This registry is empty!	

Submit Transaction

Here you can see the assets and participants we've made.

b. Create the assets and participants

Hit **+ Create New Participant** on the top right. A dialogue box will appear prompting you to enter details of the new participant:

Create New Participant

In registry: **org.acme.model.Collector**

```

1  {
2    "$class": "org.acme.model.Collector",
3    "email": "8709",
4    "firstname": "",
5    "surname": ""
6  }

```

☐ Optional Properties

Just need quick test data? [Generate Random Data](#)

Cancel

Create New

Enter the following:

```
{
  "$class": "org.acme.model.Collector",
  "email": "louis@yahoo.com",
  "firstname": "Louis",
  "surname": "Funes"
}
```

Fill this in and select **Create New**, you will see the new participant appear:

PARTICIPANTS	Participant registry for org.acme.model.Collector	
Collector	ID	Data
ASSETS Marble	louis@yahoo.com	{ "\$class": "org.acme.model.Collector", "email": "louis@yahoo.com", "firstname": "Louis", "surname": "Funes" }
TRANSACTIONS All Transactions		

Create a second Collector with the following:

```
{
  "$class": "org.acme.model.Collector",
  "email": "jean@fr.com",
  "firstname": "Jean",
  "surname": "Marais"
}
```

Press **Create New**.

If you swap to the Marble asset and select **+ Create New Asset** you will see a similar dialogue box:

Create New Asset

In registry: **org.acme.model.Marble**

```

1  {
2    "$class": "org.acme.model.Marble",
3    "Id": "0503",
4    "owner": "resource:org.acme.model.Collector#1927",
5    "diameter": 0,
6    "colour": ""
7  }

```

☐ Optional Properties

Enter the following. Note that when **filling out relationships**, you must supply a fully qualified **identifier** – this being as follows:

resource:<namespace>.<resource name>#identifier

```

{
  "$class": "org.acme.model.Marble",
  "Id": "1",
  "owner": "resource:org.acme.model.Collector#jean@fr.com",
  "diameter": 10,
  "colour": "red"
}

```

You will see the new asset appear.

PARTICIPANTS	Asset registry for org.acme.model.Marble		+ Create New Asset
Collector	ID	Data	
ASSETS	1	<pre>{ "\$class": "org.acme.model.Marble", "Id": "1", "owner": "resource:org.acme.model.Collector#jean@fr.com", "diameter": 10, "colour": "red" }</pre>	Collapse
Marble			
TRANSACTIONS			
All Transactions			

If you select **Submit Transaction** at the bottom left you will see a similar dialogue box:

Submit Transaction

Transaction Type

ChangeOwner

```
1  |{
2    "$class": "org.acme.model.ChangeOwner",
3    "txId": "",
4    "marble": "resource:org.acme.model.Marble#5989",
5    "newOwner": "resource:org.acme.model.Collector#6678"
6  }
```

☐ Optional Properties

Just need quick test data? [Generate Random Data](#)

Cancel

Submit

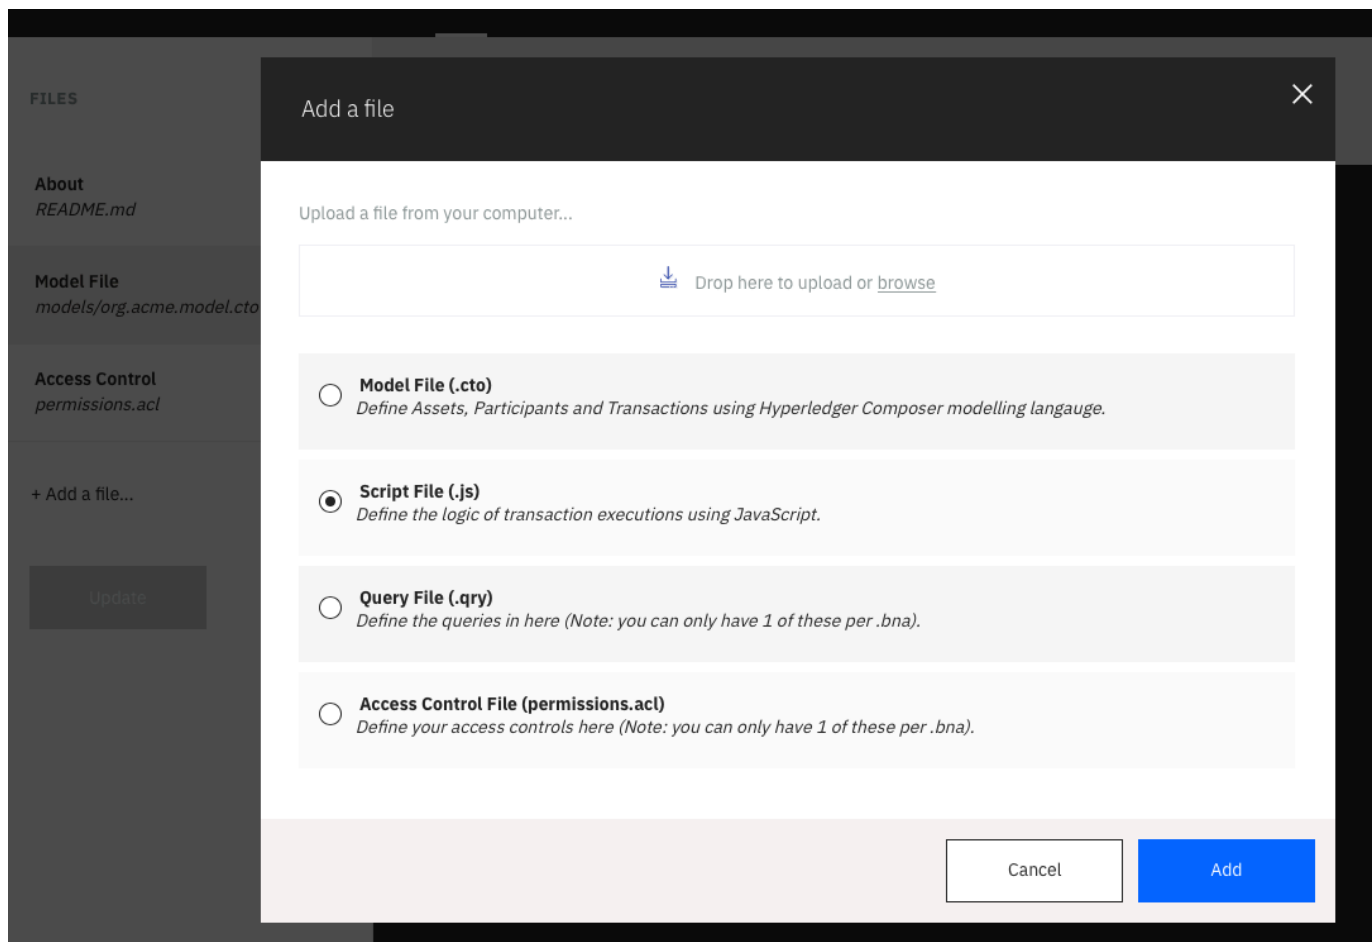

However if you submit this transaction, nothing will happen. We need to define some logic to associate with it. Before moving on to the next section, try creating another participant and an asset.

Section 3.Transaction Logic

In this section we will explore how to write transaction processor functions, these being the business logic that is executed when a transaction is invoked in Hyperledger Composer. Please note, while transaction processor functions are analogous to chaincode in their purpose we are not writing chaincode in this lab. Composer transaction logic, while achieving the same results, is not handled in the same way as chaincode is.

3.1. Create the logic file

Go back to the tab **Define** and select **+ Add a file...** from the left hand side and select **Script File (.js)** from the dialogue:

3.2. Add the changeOwner function

Within the new file add the following:

```
/**
 * @param {org.acme.model.ChangeOwner} args - the changeOwner transaction arguments
 * @transaction
 */
```

```
function changeOwner(args) {  
  
}
```

Transaction processor functions are defined by writing a function with a JS Doc decorator that maps the first argument to the transaction's model definition. The `args` argument represents the incoming transaction, in particular the data packaged in it.

Recall the transaction's definition:

```
transaction ChangeOwner {  
    --> Marble marble  
    --> Collector newOwner  
}
```

`Args` is an object where the keys are each of the attributes and the values are what has been attached to them during the transaction invocation.

`args` will have a `marble` and a `newOwner` attribute that are accessed the same way attributes are accessed in JS objects: `args.marble` or `args.newOwner`.

Transaction processor functions do not return anything, much like `Invoke` functions in Fabric, they simply execute and finish.

3.3. Add changOwner's body

The scenario of the lab is to change the owner of a marble. You will need to add 2 lines to the body of `changeOwner` function.

When the update has been made to the asset, we need to update the assets record in the world state. Add the following:

```
return getAssetRegistry('org.acme.model.Marble').then(function(marbleRegistry) {  
    return marbleRegistry.update(args.marble);  
});
```

Registries are indexes used by composer to store resources ; they store a reference to every instance of that particular resource. To update a resource, we get the registry (`getAssetRegistry(...)`) from its type and call the update function with the new version of the resources we want to update (composer will find it within the registry and update it for us).

Participants also have registries and are updated in the same way (although with `getParticipantRegistry`).

Notice that, while the language composer (used for its transaction process functions) is JavaScript, it only supports up to ES5, as such features like `() => {}` functions are not permitted. This is due to the Otto JavaScript engine that is currently used by composer. Otto is set to be replaced by an embedded version of node.js in a future release.

3.4. Test changeOwner

a. Create the assets and participants

Deploy the code and go to the Test tab. We are going to transfer a Marble between two Collectors. If you don't have 2 Collectors or a Marble follow the steps in 2.3 to create them:

Asset

ID	Data
1	<pre>{ "\$class": "org.acme.model.Marble", "Id": "1", "owner": "resource:org.acme.model.Collector#jean@fr.com", "diameter": 10, "colour": "red" }</pre> <div>Collapse</div>

Participants

Define	Test	admin	
Participant registry for org.acme.model.Collector		+ Create New Participant	
ID	Data		
jean@fr.com	<pre>{ "\$class": "org.acme.model.Collector", "email": "jean@fr.com", "firstname": "Jean", "surname": "Marre" }</pre>		 
louis@yahoo.com	<pre>{ "\$class": "org.acme.model.Collector", "email": "louis@yahoo.com", "firstname": "Louis", "surname": "Funes" }</pre>		 

b. Submit the transaction

Select **Submit Transaction** from the sidebar and fill in the fields accordingly to select your marble and the Collector who is not the owner:

```
{
```

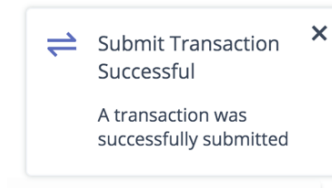

```

"$class": "org.acme.model.ChangeOwner",
"marble": "resource:org.acme.model.Marble#1",
"newOwner": "resource:org.acme.model.Collector#louis@fr.com"
}

```

Select **Submit** to issue the transaction.

If successful, the following dialogue will appear:

A transaction entry will also appear: click on **All Transactions** menu, then click on **view record** in front of the first record of the list, which **Entry type** should be **ChangeOwner**. Then you will see the following window.

Historian Record
×

Transaction
Events (0)

```

1  {
2    "$class": "org.acme.model.ChangeOwner",
3    "marble": "resource:org.acme.model.Marble#1",
4    "newOwner": "resource:org.acme.model.Collector#louis@fr.com",
5    "transactionId": "15fd0ae5-11fb-46f0-b796-b7027ad53848",
6    "timestamp": "2018-01-29T16:43:47.733Z"
7  }

```

If you go back to the Marble, you will find its record has also been updated:

ID	Data
1	<pre>{ "\$class": "org.acme.model.Marble", "Id": "1", "owner": "resource:org.acme.model.Collector#louis@fr.com", "diameter": 10, "colour": "red" }</pre> <div>Collapse</div>

Section 4. Access Control

In this section, we will explore how Hyperledger Composer restricts access to the resources on the network and the ability to modify them.

4.1 Access Control Lists (ACL) - Grammar

We now have some digital assets defined and the ability to move them between users. However, in a real system, it would likely be the case that the Marble objects would not be available for all to see and if they were they would not be available for just anyone to change the ownership of.

ACL Rules are of the following format:

```
rule <Rule Name> {
  description: <description of the rule>
  participant(p): <namespace and name of the participant performing the action>
  operation: <operation the participant wishes to perform>
  resource(r): <resources the operation is being performed on>
  condition: (<condition under which this rule applies>)
  action: <does this rule allow an operation or deny it>
}
```

In more detail:

Participant is the person or entity that has submitted the transaction.

Operation is what they wish to do to this resource, supported operations are CREATE, READ, UPDATE, DELETE, ALL

Resource is the asset that the transaction is being applied to. Resources (and indeed Participants) can simply be namespaces in which case they apply to all participants/resources in that namespace.

Condition is a JavaScript statement that can examine the participant and resource to check for certain conditions. Anything valid for use in an if statement is valid here.

Action is a simple ALLOW or DENY, as the name suggests this allows or denies the transaction.

4.2 Adding rules

Go to the **Define** tab, and select the **Access Control (permission.acl)** file:

Web tutorial-network Define Test admin

FILES

ACL File permissions.acl

Script File
lib/script.js

Access Control
permissions.acl

+ Add a file...

Update

Import/Replace

Export

```

1 rule NetworkAdminUser {
2   description: "Grant business network administrators full access to user resources"
3   participant: "org.hyperledger.composer.system.NetworkAdmin"
4   operation: ALL
5   resource: "***"
6   action: ALLOW
7 }
8
9 rule NetworkAdminSystem {
10  description: "Grant business network administrators full access to system resources"
11  participant: "org.hyperledger.composer.system.NetworkAdmin"
12  operation: ALL
13  resource: "org.hyperledger.composer.system.*)"
14  action: ALLOW

```

Everything looks good!
Any problems detected in your code would be reported here

Legal Playground v0.16.2 Tutorial Docs

Add the following rule:

```

rule OnlyOwnerCanUpdateAMarble {
  description: "Only an owner can edit a marble"
  participant(p): "org.acme.model.Collector"
  operation: UPDATE
  resource(r): "org.acme.model.Marble"
  condition: (r.owner.getIdentifier() == p.getIdentifier())
  action: ALLOW
}

```

This rule ensures that only the owners of Marble resources are able to edit them. It does this by ALLOWing an UPDATE to org.acme.model.Marble resources only when the identifier of the participant and the resource's owner are the same.

By default, all action is restricted unless explicitly permitted. As such while we do have a rule allowing updates of a Marble resource even the owner would be unable to read it. Add the following:

```

rule AnyoneCanReadMarbles {
  description: "All the participants can read the marble"
  participant(p): "org.acme.model.Collector"
  operation: READ
  resource(r): "org.acme.model.Marble"
  condition: (true)
  action: ALLOW
}

```

This rule allows all Collector participants to READ all Marbles.

We'll also need a rule to let Collectors read each other. The ChangeOwner transaction requires a submission of the identifier of a new owner which will not be possible if Collectors cannot read each other:

```
rule AnyoneCanReadCollectors {
  description: "Only an owner can edit a marble"
  participant(p): "org.acme.model.Collector"
  operation: READ
  resource(r): "org.acme.model.Collector"
  condition: (true)
  action: ALLOW
}
```

To update the Marble through the ChangeOwner transaction, another rule is needed. In particular we need to allow participants to create change owner transactions:

```
rule AnyoneCanIssueChangeOwner {
  description: "The participants can use the ChangeOwner transaction to update the marble"
  participant(p): "org.acme.model.Collector"
  operation: CREATE
  resource(r): "org.acme.model.ChangeOwner"
  condition: (true)
  action: ALLOW
}
```

Even with this rule, the transaction could be created by a non-owner but would still be rejected as they lack update access.

And finally, we are adding a rule in order to let the participants access to the objects through the composer for the purpose of the coming test :

```
rule ParticipantCanReadNetwork {
  description: "Participant can read the business network"
  participant(p): "org.acme.model.Collector"
  operation: ALL
  resource(r): "org.hyperledger.composer.system.*)"
  condition: (true)
  action: ALLOW
}
```

Now, you have completed the ACL changes.
Click on the **Update** button to take into account the ACL.

4.3 Testing the rules

Now, we will create a new user for the coming test: click on the top right menu (beside the user “admin”), then click on the **Id Registry** menu.

Create a new user clicking on the top right button : **Issue New ID**

On the Issue New Identity window, fill in

ID Name : jean

Participant : jean@fr.com

Issue a new ID to a participant in your business network

ID Name* jean

Participant* j

☐ Allow this ID to issue new IDs (...)

jean@fr.com Collector

Issuing an identity generates a one-time secret. You can choose to send this to somebody or use it yourself when it has been issued.

Cancel Create New

Then click on **Create New** button. The user **jean** is created as shown on the following screen.

Web tutorial-network Define Test admin

My IDs for tutorial-network Issue New ID

ID Name	Status
admin	In Use
jean	In my wallet

Use now Remove

All IDs for tutorial-network

ID Name	Issued to	Status
admin	admin (NetworkAdmin)	ACTIVATED
jean	jean@fr.com (Collector)	ACTIVATED

Revoke

Then click on the line “jean” in the “My IDs...” list. It will select **jean** as the new user (**jean** is displayed instead of **admin** in the top right).

Go to the test window (Click on Test) then click on the **Submit Transaction** button.
Fill in the following info then click on submit :

```
{
  "$class": "org.acme.model.ChangeOwner",
  "marble": "resource:org.acme.model.Marble#1",
}
```

```
"newOwner": "resource:org.acme.model.Collector#jean@fr.com"
}
```

You should get an error since the Marble #1 is owned by [louis@fr.com](#) and there is a rule which restricts the update of Marble to the owner.

So change from **jean** to **admin** user :

- click on the top right menu (beside the user "jean"), then click on the **Id Registry** menu,
- Then click on the line "admin" in the "My IDs..." list. It will select **admin** as the new user (**admin** is displayed instead of **jean** in the top right).

Go to the test window (Click on Test) then click on the **Submit Transaction** button.

Fill in the following info then click on submit :

```
{
  "$class": "org.acme.model.ChangeOwner",
  "marble": "resource:org.acme.model.Marble#1",
  "newOwner": "resource:org.acme.model.Collector#jean@fr.com"
}
```

The transaction is successful and the marble #1 is now owned by jean.

So switch back from admin to jean :

- click on the top right menu (beside the user "jean"), then click on the **Id Registry** menu,
- Then click on the line "jean" in the "My IDs..." list. It will select **jean** as the new user (**jean** is displayed instead of **admin** in the top right).

Go to the test window (Click on Test) then click on the **Submit Transaction** button.

Fill in the following info then click on submit :

```
{
  "$class": "org.acme.model.ChangeOwner",
  "marble": "resource:org.acme.model.Marble#1",
  "newOwner": "resource:org.acme.model.Collector#louis@fr.com"
}
```

The transaction is successful and the marble #1 is now owned by louis.
